Plate tectonics (from the Late Latin tectonicus, from the Greek: ἰσχυρὸν, ἰσχυρὸν, ἰσχυρὸν, "pertaining to building") is a scientific theory describing the large-scale motion of seven large plates and the movements of a larger number of smaller plates of the Earth's lithosphere, since tectonic processes began on Earth between 3 and 3.5 billion years ago. The model builds on the concept of continental ...

Plate Tectonics - VDOE

Plate tectonics is a theory of geology. It explains movement of the Earth's lithosphere which is the earth's crust and the upper part of mantle. The lithosphere is divided into several plate, some of which are very big and can be entire continents.. Dissipation of heat from the mantle is the original source of energy driving plate tectonics. Exactly how this works is still a matter of debate.

It is possible that comparison of incompatible element ratios in basalts from terrestrial oceanic tectonic settings with mare basalts from the Moon and to shergottites from Mars may be useful in constraining when plate tectonics began on Earth, since these two bodies are examples of stagnant lid planets.

From the 1930s to the late 1950s, works by Vening-Meinesz, Holmes, Umbgrove, and numerous others outlined concepts that were close or nearly identical to modern plate tectonics theory. In particular, the English geologist Arthur Holmes proposed in 1920 that plate junctions might lie beneath the sea, and in 1928 that convection currents within the mantle might be the driving force.
